

JOBZ! Login Authentication

When a user launches JOBZ! from the shortcut on the desktop (or uses the Open Remote command and selects the Get_JOBZ file from the hosts dialog), the first screen they should see is the JOBZ! login screen with the JOBZ! branding, their formal name and their JOBZ! password.

All they need to do at this point is click the Login link (or hit Enter twice.) The password field is dimmed for security.

If this screen does not appear, but instead a plain account name / password dialog, this means they are not authenticating correctly. Either the user is not a member of the Active Directory group that JOBZ! authenticates to, or their network login name is not entered correctly in JOBZ!

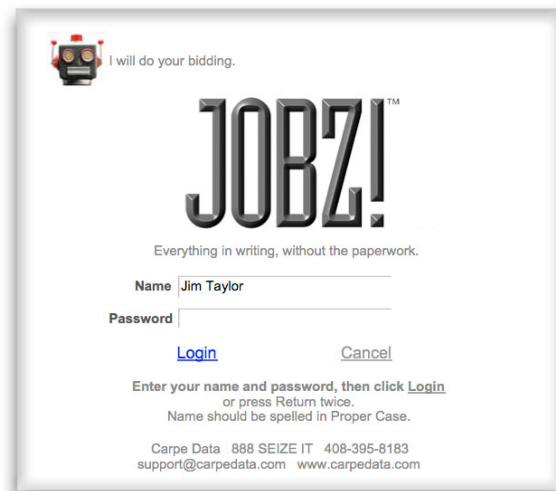

JOBZ! does not store or use their network login password, only their login name. If there is a match, the JOBZ! login screen appears. If not, the plain dialog appears, for which only a senior administrator has the login and password.

Note for Mac users: the network login name should be entered into JOBZ! as domain\username

If user is not a member of the Active Directory group, or their network login is not entered correctly in JOBZ! this dialog appears:

Authentication Failure

Authentication Success
